QuestionAnswer What are the key differences between current and non-current liabilities in Intermediate Accounting 2? Current liabilities are obligations due within one year or within the company's operating cycle, such as accounts payable and short-term debt. Non-current liabilities are obligations not due within this period, including long-term debt, lease obligations, and pension liabilities. Understanding these distinctions is crucial for accurate financial statement presentation and analysis. How is bond issuance recorded in Intermediate Accounting 2? Bond issuance is initially recorded at the cash received, which may differ from the face value due to premium or discount. Bonds issued at a premium are recorded by crediting bonds payable and debiting cash and premium on bonds payable, whereas bonds issued at a discount involve debiting cash and discount on bonds payable and crediting bonds payable. Over time, amortization adjusts interest expense accordingly. What methods are used to amortize a bond discount or premium in Intermediate Accounting 2? The two primary methods are the straight-line method and the effective interest method. The effective interest method amortizes the discount or premium based on the bond's carrying amount and market interest rate, providing a more accurate reflection of interest expense over the bond's life. The straight-line method evenly allocates the amount over the periods but is less precise. How are leases classified and recorded in Intermediate Accounting 2? Leases are classified as either operating or finance leases based on criteria such as transfer of ownership, lease term, and present value of lease payments. Finance leases are recorded on the lessee's balance sheet as an asset and liability, reflecting the present value of lease payments. Operating leases are generally disclosed in the notes but may not be recorded on the balance sheet, depending on accounting standards. What is the accounting treatment for impairment of long-lived assets in Intermediate Accounting 2? When there is evidence that a long-lived asset may be impaired, an impairment test is performed by comparing the asset's carrying amount to its recoverable amount (higher of fair value less costs to sell and value in use). If the carrying amount exceeds the recoverable amount, an impairment loss is recognized in the income statement, reducing the asset's book value accordingly.
