Function: Xylem is responsible for the transportation of water and mineral salts from the roots to the stems and leaves of a plant.

Explanation: Xylem vessels are hollow, tube-like structures composed of dead cells that form continuous channels. They facilitate the upward movement of water through capillary action and transpiration pull, ensuring that all parts of the plant receive adequate moisture essential for photosynthesis and growth.

Chemistry

Question 4: Describe the process of simple distillation and give an example of a mixture separated using this method.

Answer:

Process: Simple distillation involves heating a liquid mixture until the component with the lowest boiling point vaporizes. The vapor is then condensed back into liquid in a separate container.

Example: Separating water from saltwater. Since water has a lower boiling point than salt, heating the mixture causes water to vaporize, leaving salt behind. The vapor then condenses into pure water in the condenser.
